

- Implement a program that asks the user for their age and then tells them if they are eligible to vote based on a minimum voting age of 18.

```
Age=int(input("enter your age: "))

If age>=18:

    print("you are eligible to vote")

else:

    print("you are not eligible to vote")
```

- Write a function that takes a grade (from 1 to 100) as input and returns a string indicating whether the grade corresponds to a fail (below 50), pass (50-69), good (70-84), or excellent (85 and above).

```
def grade(marks):
    if marks<50:
        print("fail")
    elif marks<=69:
        print("pass")
    elif marks<=84:
        print("good")
    else:
        print("Excellent")
grade(75)
```

- Create a simple calculator that takes in two numbers and an operator (+, -, *, /) and performs the operation based on the operator, handling division by zero errors using conditional statements.

```
a = float(input("Enter first number: "))
b = float(input("Enter second number: "))
op = input("Enter operator (+, -, *, /): ")

if op == "+":
    print("Result:", a + b)
elif op == "-":
    print("Result:", a - b)
elif op == "*":
    print("Result:", a * b)
elif op == "/":
    if b != 0:
```

```
    print("Result:", a / b)
else:
    print("Error: Division by zero ")
else:
    print("Invalid operator ")
```

- Develop a program that determines whether a given year is a leap year or not, using conditional statements to apply the rules for leap years.

```
year = int(input("Enter year: "))

if (year % 4 == 0 and year % 100 != 0) or (year % 400 == 0):
    print("Leap Year ")
else:
    print("Not a Leap Year ")
```

- Write a conditional statement that checks if a given number is odd or even and prints out the result.

```
num = int(input("Enter a number: "))

if num % 2 == 0:
    print("Even number")
else:
    print("Odd number")
```
