

1. What is Python?

Ans:python is High Level, Interpreted, Platform independent,Dynamically typed language that is easy to understand and learn, it supports OOPS

2. Is Python case-sensitive?

Ans. Yes, Python is **case-sensitive**.

Ex:name and Name are treated as **different variables**.

3. What is the extension of a Python file?

Ans. Python files use the extension: .py

4. Who created Python?

Ans. Python was created by Guido van Rossum

5. Is Python compiled or interpreted?

Ans. Python is mainly an interpreted language, but it actually works in a hybrid way:

- First, it is compiled into bytecode
- Then, it is interpreted by the Python Virtual Machine (PVM)

6□. What is a variable in Python?

Ans. A **variable** is a name used to store data (value) in memory.

Ex: x=10

7□. Write a variable to store your name.

Ans. name="sanjana"

8□. Can a variable name start with a number?

Ans. No, a variable name **cannot start with a number**.

9□. Which is valid: my_name or my-name?

Ans. **my_name** is valid

10. Is Age and age same variable?

Ans. No, they are **different variables** (Python is case-sensitive).

11 □. Identify the invalid variable name:

1name(**invalid**)

name_1

_name

name\$(**invalid**)

12 □. Write variables to store:

Age: age=18

Salary: salary=5000

City: city="hyderabad"

13. What happens if you assign new value to same variable?

Ans. The old value gets replaced (overwritten) by the new value.

14. Can we use Python keywords as variable names?

Ans. No, we cannot use Python keywords as variable names.
